

arcway™

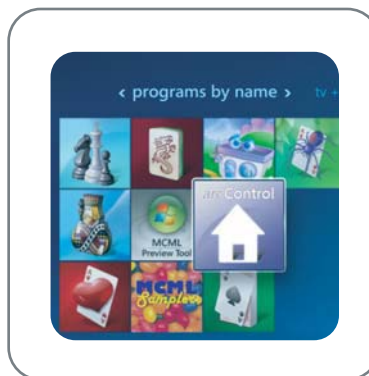

wireless home device gateway

The ArcWay™ wireless home device gateway bridges ZigBee and Ethernet networks, allowing devices using either protocol to communicate with each other. As a result, Windows PCs can be used for centralized control of ZigBee compliant devices. Imagine your lights dimming automatically when watching a movie on Windows Media Center. Forgot to lock up? Use the ArcRemote™ to control any ZigBee compliant wireless home device.

Network Zigbee-compliant home automation devices for control through Windows Vista and the ArcRemote™ Universal remote control.

All ArcLight panels are networked by the ArcWay Home Device Gateway (Lutron® faceplate pictured. Others available.)

Control all home lighting from a central control panel on your PC using Windows Vista...

...or through the ArcRemote™ Universal remote control for wireless home devices

arcway™

wireless home device gateway

Industry standards

- Contains an integrated ZigBee™ radio to communicate with all ZigBee™ devices
- Uses WSD architecture for secure messaging, dynamic discovery, description and eventing
- Built on open standards for maximum interoperability between vendors

Feature rich

- Automatic plug-and-play installation
- Built-in web server for zero-software install
- Control your home from any laptop, PC or any WSD-enabled controllers such as Exceptional Innovations Life|ware™
- PC software allows functionality to be added, which may not be natively supported in a ZigBee™ device

Microsoft Vista Ready

Utilizes Windows Rally technologies for powerful Vista application integration.

Control your ZigBee™ devices, or monitor the status of your home from within Media Center using the ArcControl™ Home Control application
